Erectile Dysfunction: Quick Facts

Erectile dysfunction, or ED, is the inability to achieve or maintain an erection sufficient for sex. This can be seen as an overall decrease in the firmness or decreased quality of one's erection. ED affects about 30 million men in the U.S.

Erectile dysfunction prevents the arteries in the penis from dilating and can often be a sign of other underlying health concerns, including cardiovascular or neurologic issues. Therefore, early diagnosis is important. If left untreated, ED can lead to loss of penile length and girth, relationship problems and diminished self-esteem.

While medications (such as Viagra™ and Cialis™) are frequently used as the first step in treating ED, they often have side effects, are inconvenient and costly. Other options, including vacuum erection devices or penile injections, can be painful and lack spontaneity.

Fortunately, we now have a better option! The Men's Health Center at Urology of Indiana is the only location in Indiana offering UWave – a revolutionary shock wave technology that can help you achieve more satisfying, longer lasting erections WITHOUT medications.

While some treatments only improve blood flow temporarily, UWave stimulates your body to build new blood vessels. UWave is unique because, unlike other lesser ED "shock wave" therapies, it delivers the energy right where your body needs it, every time. Other shock wave therapies used in different clinics only target the skin and don't penetrate deep enough to reach the actual erectile tissues.

Jason R. Kovac, MD, PhD

Alexander J. Tatem, MD

The physicians at the Urology of Indiana Men's Health Center are internationally recognized experts in the treatment of ED and are dedicated to finding the solution that's right for you. Call 317.960.1960 to schedule your UWave consultation today.

How Does UWave Work?

UWave is a safe, comfortable, and non-invasive shock wave therapy performed by our experts at the Men's Health Center. Instead of increasing the body's blood flow temporarily, UWave actually treats the underlying cause of ED by improving your own **natural blood flow**. While medicines may "mask" the symptoms of ED, UWave can improve and eliminate erectile difficulties.

Administered over the course of just 6 twice-weekly sessions, many patients notice an improvement in their erections within a few weeks.

Gentle pulses of low-intensity shock waves generated outside the body (known as extracorporeal shock waves) are applied to multiple areas of the penis. This process stimulates the body to repair existing blood vessels while stimulating new blood vessel creation within the erectile bodies of the penis. This improves blood flow and, in turn, erectile function!

UWave is not appropriate for everyone. Men who have suffered damage to the nerves that supply erections (such as those who have undergone pelvic surgery or prostate removal) may be less likely to benefit from UWave. Our expert team at the Men's Health Center can still find the right treatment for you. **No matter how serious you think your ED might be, there is always hope!**
